

## Let's Outsmart Ourselves

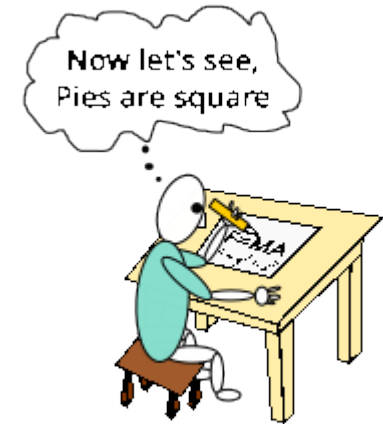

Town ordinances and building codes are now being changed to directly reflect the laws of physics, and it looks like taxes are on the rise.

As highly educated mathematicians and physics professors are being replaced by AI they are retreating to small towns across new England by the thousands.

One professor was quoted, " yeah , it is too smart for us to compete with anymore. The kids just aren't buying the " professor thing anymore", so its up and onward or to put it simply, " its time to get a town job". So professors are becoming town administrators by the thousands , replacing small town thinking with the high mindedness of incredibly difficult physics illusions and making building codes to match!

One professor said, " we are replacing total control, with total control with standards that fit into universal theoretical standards. To put it short... "nobody is gonna do anything" ..he chuckled..

To get a permit to fix your roof, the laws of physics require a standard , " gravitational fitness survey" which costs about \$80,000 dollars and must be done by a " professor of physics".. it gets better he said .. if you need a permit to build a house.. you might as well leave

town he chuckled. You now need to provide clear safety evaluations which include cosmic radiation events and show that the structure will be safe " for all time", ..veering away from the old standards based on simple building plans. We live in a new world now, ...but if you plan on building anything or doing home improvements ..don't plan on doing them here.

Our reporter asked.. who is supporting all this? Well, the town board has been replaced with economic professors who in partnership with the alliance of "Make America Green Again, have assured us that if we apply the proper laws prices of land will drop to about net zero, nature will reclaim most of the territory and only people who can pay millions will live here, which is basically a better balanced situation for everyone.

The other people can move into areas better suited for larger populations.. like Indonesia or even Ireland. We heard a lot of people live in those places so we are sure they will be welcomed there.

Our reporter pocketed these notes and other statements.. and thought..you know life was better when your nearest neighbor was 80 miles away.
